GOKULAHEALTH

Problem Brief

Product Management Case Study | V1 → V2

Product Discovery Artifact

Product	GokulaHealth
Artifact	Problem Brief
Phase	Product Discovery
Version	V1 → V2
Status	Draft for Validation
Document Owner	Bhagyashree Reddy

1. Product Context

- **Overview:** GokulaHealth is an offline-first Android application designed to help cattle owners and dairy operators maintain and manage cattle-related records digitally.
- **Context:** Designed for rural and small-scale cattle-management environments where internet connectivity is often unreliable and records (milk production, cattle information, vaccinations) are traditionally kept manually.

V1 Features: Includes cattle registration, milk-production tracking, vaccination and medical records, production analytics, and cattle-level trends.

2. Problem Background

Cattle and dairy operators may need to maintain records such as daily milk production, morning and evening milk yield, cattle information, vaccination records, medical records, and production history.

When these records are maintained manually, reviewing and calculating production performance can become time-consuming and difficult to manage.

The original problem behind GokulaHealth was the difficulty of maintaining cattle-management information manually and obtaining useful insights from the recorded data.

GokulaHealth addresses this by providing a digital, offline-first environment for recording and reviewing cattle and milk-production information.

3. Target Users

- **Primary User:** Small-scale cattle/dairy operators or cattle owners responsible for maintaining records and monitoring daily milk production.
- **Potential Secondary Users:** Family members involved in farm management, farm workers, small dairy operators, and larger/commercial cattle-farm operators.

Validation Note: Broader user groups represent prospective segments and require further validation.

4. User Problem

Cattle/dairy operators may maintain milk-production records manually, which can make monthly calculation and analysis time-consuming.

GokulaHealth already captures daily milk-production data, but its current production/analytics experience can be difficult to understand and does not provide enough useful information for quickly reviewing monthly performance.

5. User Research Insight

- **Participant Context:** Discovery was conducted with a prospective user planning a large-scale cattle milk business.
- **Key Findings:** Notebook record-keeping makes monthly calculations time-consuming; automated calculation and performance insights are highly desirable.

Research Limitation: Findings represent early prospective-user discovery signals rather than broad market validation across multiple active operators.

6. Key User Pain Point

Difficulty and time involved in calculating and understanding monthly milk-production performance from manually maintained records.

The user needs a simpler way to maintain daily production records and understand the resulting monthly performance.

7. Desired User Outcome

- **Core Needs:** Maintain digital milk records, track morning/evening yields, review monthly totals and averages, compare shifts, and identify individual cattle variances.

Information Hierarchy: Monthly totals, monthly averages, and shift comparisons (morning vs. evening) are highest priority; cattle-level comparisons are secondary.

8. Current V1 Product

- **Milk Production:** Captures morning/evening yield and saves diary records with basic monthly totals and averages.
- **Cattle Management:** Registers cattle profiles and tracks individual animal data.
- **Vaccination & Health:** Logs health records and schedules upcoming vaccination dates.
- **Offline-First Architecture:** Fully operational without internet connectivity for rural usability.

Analytics: Provides basic production analytics and individual cattle trends.

9. V1 Problem Observations

- **9.1 Cattle Registration:** UI defect with white text displayed on a white background, causing poor readability.
- **9.2 Analytics Visibility:** Low visual contrast makes key metric graphs hard to read.
- **9.3 Individual Cattle Trends:** The 30-day trend chart lacks clarity in purpose and interpretation.

9.4 Factory Production Comparison: Incomplete feature set with unclear user value.

10. Product Opportunity

The opportunity is not simply to add more analytics. The opportunity is to make existing milk-production data easier to maintain, understand, and use for monthly performance review.

V2 opportunity: Improve GokulaHealth's milk-production record and analysis experience so users can easily maintain their production records and quickly understand their monthly total and average milk production.

11. Product Goal

Make milk-production records easier to maintain and monthly production performance easier to understand.

12. Initial Scope Direction

- **Primary Scope:** Milk-production entry flow, monthly total yield, monthly averages, morning vs. evening comparison, and clear visual analytics.
- **Secondary Scope:** Cattle-level production comparisons and enhanced trend charts.
- **Deferred / Out of Scope:** Factory production comparison, advanced predictive analytics, and unvalidated features.

Scope Governance: Final scope will be refined through continuous research and prioritization matrix.

13. Success Direction

- **Core Objective:** Users can log milk yields and evaluate monthly performance faster and with greater clarity than in V1.

Key Validation Metrics: Time to record production, time to comprehend monthly summaries, entry completion rates, insight usage, and user satisfaction scores with analytics.

14. Key Assumptions to Validate

- Manual record keeping is a significant problem for the target users.
- Monthly production calculation is sufficiently time-consuming to justify a dedicated digital solution.
- Monthly total and average production are the most valuable insights.
- Users will regularly record morning and evening milk production.
- Users will understand and use production analytics if information is presented more clearly.
- Offline-first functionality is important for the target user group.
- The target-user segment is sufficiently broad to include both small and larger cattle/dairy operators.
- These assumptions should be validated through additional user research and product testing.

15. Problem Brief Summary

- **User:** Small-scale cattle/dairy operators and owners needing reliable digital record-keeping.
- **Problem:** Manual record-keeping makes monthly production calculations slow and prone to overhead.
- **Existing V1:** Offers offline-first cattle management, production logging, health tracking, and basic analytics.
- **V1 Gap:** Data is collected, but visual clarity and monthly performance summaries are lacking.
- **Opportunity:** Redesign the milk logging and monthly analysis workflow for maximum clarity.
- **Product Goal:** Simplify daily entries and make monthly production performance intuitive to review.

Next Steps: Conduct broader user validation and translate key findings into defined V2 product requirements.
