GOKULAHEALTH

V2 Figma Prototype Specification

Product Management Case Study | V1 → V2

UX / Product Design Specification

Product	GokulaHealth
Artifact	V2 Figma Prototype Specification
Phase	UX / Product Design
Version	V2
Status	Design Preparation
Document Owner	Bhagyashree Reddy

1. Purpose

This document defines the Figma prototype that will communicate the proposed GokulaHealth V2 experience. It translates the approved PRD, prioritization, and roadmap into a small set of testable product screens.

The prototype should demonstrate how the V2 experience improves milk-production recording and makes monthly production performance easier to understand.

This document is a design specification, not a claim that the proposed V2 screens have already been implemented in the application.

2. Design Objective

Make milk-production records easier to maintain and monthly production performance easier to understand.

- Reduce friction during morning and evening production entry.
- Make monthly total and average production immediately understandable.
- Make morning-versus-evening production comparison clear.
- Improve analytics readability, labels, hierarchy, and context.
- Preserve the offline-first nature of the core workflow.

3. Design Scope

3.1 V2 Prototype — Core Screens

- Production Dashboard / Monthly Summary
- Milk Production Entry
- Save / Confirmation State
- Production History / Record Review
- Morning vs Evening Comparison
- Production Analytics
- Relevant navigation states connecting the core workflow

3.2 Secondary / Validation Screens

- Individual Cattle 30-Day Trend — only if represented as a validation concept
- Factory Production Comparison — only if represented as a future/validation concept

3.3 Do Not Prototype as V2 Core

- Cloud synchronization
- Multi-user account/role management
- Payments/subscriptions
- Unvalidated AI analytics
- Enterprise farm-management modules

4. Figma File Structure

1. Page 1 — V1 Reference
2. Page 2 — V2 User Flow
3. Page 3 — V2 Wireframes
4. Page 4 — V2 High-Fidelity Prototype
5. Page 5 — Components / Design Notes
6. Page 6 — Validation & Iteration

Keep the actual V1 screenshots/design references separate from the proposed V2 screens so the portfolio clearly distinguishes what already existed from what was designed as an improvement.

5. V1 → V2 Design Problems

V1 Observation	Design Problem	V2 Design Response
Production information can be difficult to understand quickly.	Important values do not have enough visual priority.	Make monthly total and average prominent.
Analytics has readability/context issues.	Users may struggle to interpret charts and values.	Improve contrast, labels, hierarchy, and explanatory context.
30-day cattle trend is unclear.	Purpose and interpretation are uncertain.	Keep behind validation rather than making it a core V2 screen.
Factory comparison is incomplete/unclear.	User value is not established.	Keep behind validation rather than making it a core V2 workflow.
Milk production is already captured in V1.	The opportunity is to improve the experience rather than rebuild the concept.	Keep the familiar production workflow while improving clarity and usability.

6. Required Figma Frames

Frame	Name	Required Content	User Outcome
Frame 01	V2 Production Dashboard	Monthly total, monthly average, morning/evening summary, and clear entry action.	User can quickly understand monthly performance and start recording production.
Frame 02	Milk Production Entry	Cattle/date context, morning value, evening value, save action, validation state.	User can enter production with minimal friction.
Frame 03	Save Confirmation	Clear confirmation after a valid production record is saved.	User knows the record was successfully stored.
Frame 04	Production History	Saved records presented clearly by date/cattle as appropriate.	User can review previously recorded information.
Frame 05	Morning vs Evening	Clear visual comparison of morning and evening production.	User can compare without manual calculation.

Frame 06	Production Analytics	Readable charts/summary cards with labels and context.	User can interpret production information without confusion.
Frame 07	Empty / Insufficient Data	Clear message and guidance when monthly information cannot yet be calculated.	User understands why a summary is unavailable and what to do next.

7. Frame 01 — V2 Production Dashboard

This is the primary V2 screen and should make the product's main value immediately visible.

- Selected month / period.
- Monthly total milk production — visually prominent.
- Monthly average milk production — visually prominent.
- Morning production summary.
- Evening production summary.
- Clear primary action to add production.
- Clear access to production history/analytics.
- Simple explanation where data is incomplete.

Design test: Can a user identify the monthly total and monthly average quickly without performing manual calculation?

8. Frame 02 — Milk Production Entry

- Cattle identification/context.
- Date.
- Morning milk-production field.
- Evening milk-production field.
- Clear Save action.
- Input validation for missing/invalid values.
- Simple confirmation path after saving.

Design test: Can a user understand what to enter and complete the record without confusion?

9. Frame 03 — Save Confirmation

- Clear confirmation message.
- Saved date/cattle context.
- Saved production values.
- Action to continue recording or return to summary.

The confirmation should be useful but not interrupt the workflow unnecessarily.

10. Frame 04 — Production History

- Chronological production records.
- Clear date labels.
- Morning/evening values.
- Readable totals or relevant summaries.
- Simple navigation back to the monthly summary.

The purpose is verification and review, not advanced analytics.

11. Frame 05 — Morning vs Evening Comparison

- Same time period across both values.
- Clearly labeled Morning and Evening.
- Consistent units.
- Simple visual comparison.
- Optional explanatory context where useful.

Design test: Can the user identify which period has higher production without manually calculating the difference?

12. Frame 06 — Production Analytics

- Readable chart or summary visualization.
- Clear title and labels.
- Clear units.
- Selected date/month context.
- Meaningful explanatory text where the chart alone may be ambiguous.
- Strong visual hierarchy for the most important information.

Do not add advanced metrics simply to make the screen look richer. Every metric should support a user decision or understanding of production performance.

13. Frame 07 — Empty / Insufficient Data

- Explain why the requested summary is unavailable.
- Show the required next action.
- Do not display misleading zero values when data is simply missing.
- Keep the state visually consistent with the main V2 experience.

14. Core Prototype Flow

7. Dashboard → Add Production
8. Add Production → Save
9. Save → Confirmation
10. Confirmation → Dashboard / History
11. Dashboard → Monthly Summary
12. Dashboard → Morning vs Evening
13. Dashboard → Analytics
14. Analytics / Summary → Feedback or next action

15. Design Principles

- Clarity over feature density.
- Important production information should have strong visual hierarchy.
- Use consistent labels for morning, evening, total, average, and date/month.
- Do not require manual calculations for information the product can present automatically.
- Use clear feedback for successful and unsuccessful actions.
- Preserve the offline-first core workflow.
- Design for a user who may not have technical knowledge.
- Keep the interface understandable before adding advanced analytics.

16. V1 → V2 Evidence to Show in Portfolio

The final Figma portfolio evidence should make the product-management reasoning visible, not only the visual design.

15. V1 screenshot / reference.
16. V1 problem callout.
17. V2 design decision.
18. V2 prototype frame.
19. Short explanation of the user problem addressed.
20. Link from the design decision back to the relevant PRD requirement/user story.

17. Usability Validation Plan

21. Ask a representative user to record a morning/evening production entry.
22. Ask the user to locate monthly total production.
23. Ask the user to locate monthly average production.
24. Ask the user to compare morning and evening production.
25. Ask the user to explain what the analytics screen means.
26. Record confusion points, task completion, and feedback.
27. Use findings to revise the prototype before implementation.

The current research sample is limited. Usability testing should therefore be treated as validation work rather than as proof of broad market behavior.

18. V2.1 Design Iteration

- Only promote the individual cattle trend into the core experience if validation shows a clear user need.
- Only promote factory comparison if its target user, decision, and value are clear.
- Add new analytics only when supported by user feedback or product evidence.
- Use post-release learning to refine the next design iteration.

19. Handoff to Jira / Scrum

- Each prioritized design flow should map to one or more user stories.
- Acceptance criteria should describe the observable behavior represented by the design.
- Design states should be available to developers before the related sprint work begins.
- Design changes after testing should be reflected in the relevant Jira items.
- The final prototype should remain linked from the PM portfolio.

20. Design Limitations

- This specification defines a proposed V2 experience; it does not claim that the V2 screens have already been implemented.
- The design should be validated before development.
- Detailed visual styling should remain consistent with the existing GokulaHealth product where practical while correcting identified usability issues.
- Future design decisions may change after usability testing.

21. Summary

The V2 Figma prototype should demonstrate a focused improvement to the existing GokulaHealth product rather than a completely new application.

The primary design outcome is a clearer production workflow: record morning/evening milk production, save it reliably, review production history, and quickly understand monthly total, monthly average, and morning-versus-evening performance.

The prototype should make the PM reasoning visible by connecting each major design decision to the V1 findings, V2 PRD, prioritization, and roadmap.
