GOKULAHEALTH

V2 Feedback & Validation Report

Product Management Case Study | V1 → V2

Artifact	Artifact #11 — Feedback & Validation
Product	GokulaHealth
Scope	V2 Milk-Production Record & Analysis Experience
Current Evidence	Initial discovery with one prospective participant
Validation Status	Pre-release — post-release feedback not yet available
Evidence Principle	Separate observed feedback, assumptions and future validation

1. Purpose

This document defines how GokulaHealth V2 feedback will be collected, interpreted and converted into product decisions. It records the evidence currently available and establishes the validation plan for the V2 release and the subsequent V2.1 iteration.

2. Current Evidence

The current evidence base is limited. Initial discovery included one prospective participant who is planning a large-scale cattle milk business. The participant has not yet started operating the business, so the feedback should be treated as an initial signal rather than validated evidence from an active cattle/dairy operator.

3. Initial Participant Feedback

Topic	Initial Feedback	Evidence Status
Record keeping	The participant indicated an intention to use a physical paper notebook for recording milk production.	Initial signal — requires validation with active operators
Monthly analysis	The participant indicated that monthly analysis/calculation can take time.	Initial signal
Automation	The participant indicated that automatic monthly calculation/analysis would be helpful.	Initial signal

4. Product Problem Being Validated

Cattle/dairy operators may maintain milk-production records manually, which can make monthly calculation and analysis time-consuming. GokulaHealth already captures daily milk-production data, but its current production/analytics experience can be difficult to understand and does not provide enough useful information for quickly reviewing monthly performance.

5. V2 Opportunity

Improve GokulaHealth's milk-production record and analysis experience so users can easily maintain their production records and quickly understand their monthly total and average milk production.

6. Product Goal

Make milk-production records easier to maintain and monthly production performance easier to understand.

7. Validated vs Unvalidated

Area	Current Evidence	Validation Status
Manual/paper record keeping	One prospective participant indicated an intention to use a notebook.	Not validated with active operators
Monthly calculation is time-consuming	Participant indicated monthly analysis/calculation takes time.	Initial signal
Automatic calculation is useful	Participant indicated it would help.	Initial signal
Monthly total is a priority	Derived from discovery discussion and V2 direction.	Needs broader validation
Monthly average is a priority	Derived from discovery discussion and V2 direction.	Needs broader validation
Morning vs evening comparison is useful	Product hypothesis based on V1/V2 analysis.	Needs validation
Analytics readability is a problem	V1 analysis identified usability/readability issues.	Requires user validation

8. V2 Validation Questions

- Can users enter morning and evening production records without confusion?
- Can users quickly find their monthly total production?
- Can users understand their monthly average production?
- Can users understand the difference between morning and evening production?
- Can users interpret the analytics without additional explanation?
- Does the improved experience reduce the effort required to review monthly production?
- Does the offline workflow remain reliable for the core production-record task?
- Which information do users actually use when making day-to-day or monthly decisions?

9. Validation Methods

- Usability walkthrough of the V2 prototype before implementation.
- Task-based testing of the implemented V2 workflow.
- Short interviews with active cattle/dairy operators.
- Observation of users entering realistic production records.
- Comparison of expected calculations with actual displayed results.
- Post-release feedback collection.
- Review of product metrics where reliable measurement is available.

10. Feedback Collection Plan

Stage	Method	Evidence	Decision Use
Before build	Prototype walkthrough	Usability observations	Refine V2 design
During QA	Task-based testing	Pass/Fail + defects	Release readiness
After release	User interviews	Qualitative feedback	Identify problems/opportunities
After release	Usage/metric review	Behavioral signals where available	Prioritize improvements
V2.1 planning	Feedback synthesis	Validated themes	Backlog and prioritization

11. Success Signals / KPIs

The following are proposed validation signals rather than achieved results. Actual values should be recorded only after implementation and real testing.

- Time or effort required to record daily milk production.
- Time required to find monthly total production.
- Time required to understand monthly average production.
- Task completion rate for key production-recording workflows.
- User-reported ease of understanding analytics.
- Number and severity of usability/functional defects found during testing.
- Frequency of users returning to review production information, if measurement is available.

12. Feedback → Product Decision Framework

1. Collect feedback without immediately treating every request as a requirement.
2. Group feedback into recurring problems, usability issues, feature requests and technical defects.
3. Assess frequency, user impact, business/product value and implementation effort.
4. Validate important themes with additional users where possible.
5. Prioritize validated problems through the existing V2 prioritization framework.
6. Add selected items to the V2.1 backlog and roadmap.

13. V2.1 Decision Rules

Evidence	Potential Decision	Action
Repeated user problem with high impact	Prioritize	Create/refine V2.1 backlog item
Usability issue blocking core task	Fix	Add corrective work to backlog
Feature request with weak evidence	Validate further	Research before prioritizing
Technical defect affecting data accuracy	High priority fix	Resolve and re-test
Low-value or low-frequency request	Defer	Keep in future backlog

14. Agile / Scrum Feedback Loop

- Sprint → Build → Test → Sprint Review → User/Product Feedback → Backlog Refinement → Next Sprint.
- The Sprint Review should focus on what was actually built and what was learned.
- The Retrospective should capture process improvements for the next sprint.
- Validated feedback can become new backlog items rather than informal undocumented requests.
- V2.1 should be based on evidence gathered after the V2 iteration.

15. Evidence Limitations

- Only one prospective participant has provided initial feedback so far.
- The participant was planning a cattle milk business and was not yet an active operator.
- No post-release user feedback exists yet.
- No adoption, usage or retention metrics exist yet for V2.
- Therefore, this document does not claim that V2 has been validated in the real world.

16. Current Status

Feedback and validation planning is complete. Initial discovery signals have been documented, but broader validation and post-release evidence remain pending.

17. Next Steps

7. Complete the V2 implementation.
8. Execute Artifact #9 QA test cases.
9. Validate the V2 workflow with additional users where possible.
10. Release only after release-readiness criteria are satisfied.
11. Collect post-release feedback.
12. Synthesize feedback and evidence.
13. Create the V2.1 decision and prioritized backlog.

Document Control

Document	GokulaHealth V2 Feedback & Validation Report
Artifact	Artifact #11
Owner	Bhagyashree Reddy
Status	Pre-release validation plan with initial discovery evidence

Originality	Portfolio artifact based on the GokulaHealth V1 → V2 product case study
